In class-based object-oriented programming, a constructor (abbreviation: ctor) is a special type of subroutine called to create an object. It prepares the new object for use, often accepting arguments that the constructor uses to set required member variables.. A constructor resembles an instance method, but it differs from a method in that it has no explicit return type, it is not implicitly ...

???? ????? ?? ??? ????? ????? ??????? ??????

????? ?????? ???????

In object-oriented programming, a class is an extensible program-code-template for creating objects, providing initial values for state (member variables) and implementations of behavior (member functions or methods). In many languages, the class name is used as the name for the class (the template itself), the name for the default constructor of the class (a subroutine that creates objects ...
